Challenges in solving Large Scale Combinatorial Optimization Problems

HEMERA – Challenge COPs

Leaders: B. Derbel, Nouredine Melab

Participants: Trong-Tuan Vu (Hemera), Asim Ali (Hemera), Mathieu Djamaï (U. Lille 1), Mohand Mezmaz (U. Mons)

DOLPHIN - INRIA Lille Nord Europe

Combinatorial Optimization

- Applications in: Logistics, Energy, Clouds, Telecommunication, etc.
- NP-Hard problems
- Resolution methods are computing intensive

Distributed Computing

- Aggregated computing resources
- New architectures and facilities, e.g. Clouds
- Impressive computing power (in theory)

Combinatorial Optimization

- Applications in: Logistics, Energy, Clouds, Telecommunication, etc.
- NP-Hard problems
- Resolution methods are computing intensive

Distributed Computing

- Aggregated computing resources
- New architectures and facilities, e.g. Clouds
- Impressive computing power (in theory)

< 回 ト < 三 ト < 三 ト

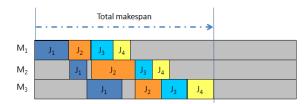

Challenge

• Solve large scale Combinatorial Optimization Problems (COPs) using huge amount of computational resources.

9 Parallel Branch-and-Bound (B&B) for Permutational FSP

- Dynamic Load Balancing
- ② Discussion and other related results
 - Large scale P2P distributed computing in COPs
 - Heterogenous computing in COPs
- Onclusion

Parallel B&B for Permutational FSP

Branch and Bound Tree Search

B&B

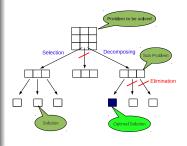

- Decomposing: split a problem into sub-problems
- Bounding: compute lower bound
- Elimination: eliminate bad branches
- Selection: chose next node to explore

Branch and Bound Tree Search

B&B

- Decomposing: split a problem into sub-problems
- Bounding: compute lower bound
- Elimination: eliminate bad branches
- Selection: chose next node to explore

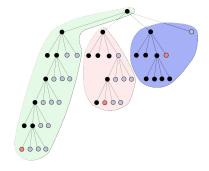

Parallel B&B

- Process B&B subtrees distributively in parallel
- Communicate the best found solution

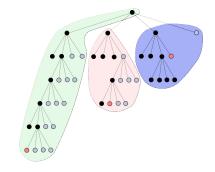

Parallel Modeling

- Perform a parallel tree traversal
 - The tree is generated at runtime
 - Unpredictable and unbalanced shape
- Unbalanced Tree Search (UTS) [Dinan et al., 2008]

Parallel Modeling

- Perform a parallel tree traversal
 - The tree is generated at runtime
 - Unpredictable and unbalanced shape
- Unbalanced Tree Search (UTS) [Dinan et al., 2008]

Main Question

• How to distribute workload over processing units, dynamically, at runtime?

Litterature overview

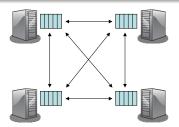

Combinatorial Optimization (B&B) Community

- Master-Worker [IPDPS'07]
- Hiearchical Master-Worker [FGCS'12, IEEE TC'13]
- B&B specific coding

Litterature overview

HPC Community

- Random Work Stealing (application independent)
- Theory:
 - Expected time: $\frac{W}{p} + O(D)$ [Blumofe et al., ACM'99]
- Practice / Applications:
 - Steal-half gives good performance [Dinan et al., SC'09]:
 - Work stealing for multicore systems [Euro-Par'11, PPoPP'13]

HPC Community

- Random Work Stealing (application independent)
- Theory:
 - Expected time: $\frac{W}{p} + O(D)$ [Blumofe et al., ACM'99]
- Practice / Applications:
 - Steal-half gives good performance [Dinan et al., SC'09]:
 - Work stealing for multicore systems [Euro-Par'11, PPoPP'13]

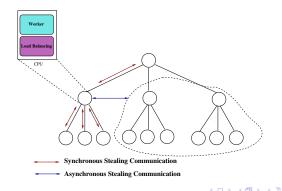

The main issues

- Where to search work?
 - Location of work is not known
- What work sharing strategy (steal granularity)?
 - Number of stealing operations

Our Contribution

Overlay-based Load Balancing

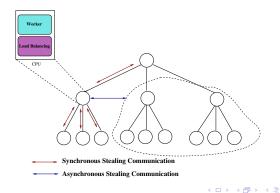

- Overlay structure and Peer Cooperation
 - Thieves cluster together along a tree overlay

Our Contribution

Overlay-based Load Balancing

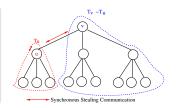

- Overlay structure and Peer Cooperation
 - Thieves cluster together along a tree overlay
- Adaptive work sharing
 - Stealing granularity adapts to peers computing power

Overlay-based granularity

Between close neighbors (synchronous)

- Children *u* steals from Parent *v*: T_u/T_v
- Parent v steals from Children u: $(T_v - T_u)/T_v$

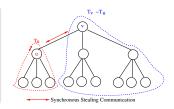

• • = • • = •

Overlay-based granularity

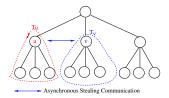

Between close neighbors (synchronous)

- Children *u* steals from Parent *v*: T_u/T_v
- Parent v steals from Children u: $(T_v - T_u)/T_v$

Between remote neighbors (asynchronous)

• Peer *u* steals from peer *v*: $T_u/(T_u + T_v)$

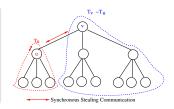

A B F A B F

Overlay-based granularity

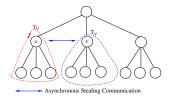

Between close neighbors (synchronous)

- Children *u* steals from Parent *v*: T_u/T_v
- Parent v steals from Children u: $(T_v - T_u)/T_v$

Between remote neighbors (asynchronous)

• Peer *u* steals from peer *v*: $T_u/(T_u + T_v)$

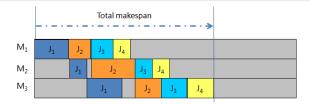

Other technical issues

- Communication of best solution (B&B specific)
- Termination detection

Application settings

- Parallel B&B: Taillard' Flowshop Instances (Ta20*20)
 - Permutational FSP: 20 jobs on 20 machines
 - Sequential execution: some hours to some days

Application settings

- Parallel B&B: Taillard' Flowshop Instances (Ta20*20)
 - Permutational FSP: 20 jobs on 20 machines
 - Sequential execution: some hours to some days
- UTS: standard benchmark

Application settings

- Parallel B&B: Taillard' Flowshop Instances (Ta20*20)
 - Permutational FSP: 20 jobs on 20 machines
 - Sequential execution: some hours to some days
- UTS: standard benchmark

Baseline algorithms

- H-MW: Hiearchical Adaptive MW (B&B-specific) [Bendjoudi et al., FGCS'12, IEEE TC'13]
- MW: Master-Worker (B&B-specific) [Mezmaz et al., IPDPS'07]
- RWS: (Distributed) Random work stealing [Dinan et al., SC'09]

Grid5000 experiments

- 2 Clusters at Nancy site
 - Griffon: 736 cores of Intel 2.5 GHz
 - Graphene: 576 cores of Intel 2.6 Ghz

Our approach vs. H-MW

Average Scale (200 peers)

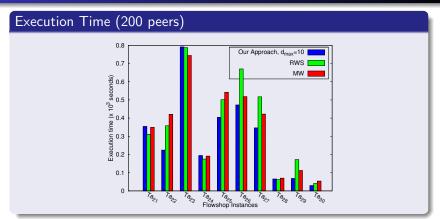

Speed-up w.r.t H-MW [FGCS'12]

Flowshop 20 * 20	Tree	Tree (asyn.)
Ta ₂₁	31.67	44.64
Ta ₂₂	1.01	1.95
Ta ₂₃	0.65	0.98
Ta ₂₄	9.1	17.27
Ta ₂₅	3.48	6.56
Ta ₂₆	4.86	6.84
Ta ₂₇	0.85	1.28
Ta ₂₈	10.78	18.58
Ta ₂₉	0.98	4.77
Ta ₃₀	5.5	10.44

- H-MW is adopting a BFS B&B-specific tree traversal strategy
- H-MW maps the B&B tree into the hierarchy to distribute work

Our approach vs. RWS vs. MW

Average Scale (200 peers)

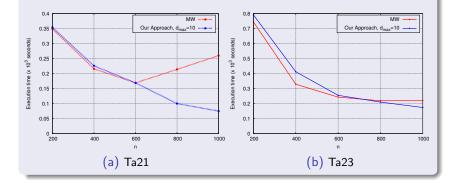

- Bottleneck in the MS centralized approach is negligible
- Both distributed and centralized schemes perform well

Our appraoch vs MW

Large Scale (1000 peers)

Scalability (up to 1000 peers)

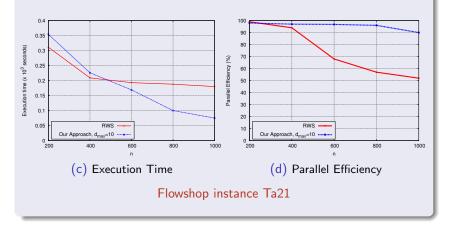

- MW suffers from bottleneck when scaling the system
- The size of the B&B tree is not constant when scaling nodes

Discussion and Limitations

Overlay impact

• Small degree (large diameter) vs. Large degree (small diameter)

э

- - E + - E +

Overlay impact

• Small degree (large diameter) vs. Large degree (small diameter)

Fault-tolerance

• Very large scale COPs cannot be solved in a single run

Overlay impact

• Small degree (large diameter) vs. Large degree (small diameter)

Fault-tolerance

• Very large scale COPs cannot be solved in a single run

Heterogeneity

- Logical vs. physical
- Mapping of multi-* resources

Scalable overlays and Fault-tolerance

Peer-to-Peer inspired approach [done]

- Hypercube, Small world graphs, etc.
- 'Simulations' results (up to 2000 cores and 8 sites) on Grid5000

A hybrid fault-tolerant extension [paper in preparation]

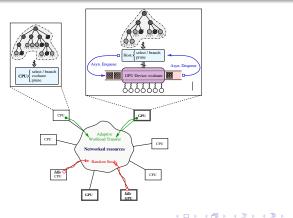

- Centralized Checkpointing
- Distributed P2P work sharing

Heterogeneity

Heterogenous computing power / ability [done]

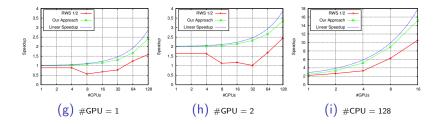

2

Heterogeneity

Heterogenous computing power / ability [done]

- CPU vs. GPU
- Near optimal parallel B&B with up to 20 GPU and 128 CPUs using 3 clusters of Grid5000

2

B ▶ < B ▶

Heterogenous computing power / ability [done]

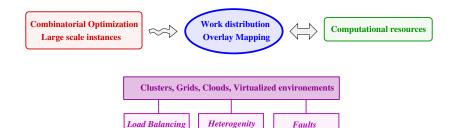

- CPU vs. GPU
- Near optimal parallel B&B with up to 20 GPU and 128 CPUs using 3 clusters of Grid5000

Heterogenous networks [Experiments in progress]

- Large scale distributed peers (e.g., latencies, throughput)
 - Overlay mapping using advanced graph structures?
 - Validation and performance assessment?
- Emulation using **Distem** on Grid5000

Next steps in COPs challenge

- Solve very large scale problem instances
- e Heterogenous distributed, networked and virtualized resources
